How do I create a drilling program for a CBM well?

The first step in creating a drilling program for a CBM well involves gathering information about existing wells in a given area. These data include: Sources of this information include: After these data are gathered and analyzed, a preliminary drilling and completion prognosis can be drafted with the input of field operations personnel.

What is a modified completion rig?

A modified completion rig is used to drill the target coals and complete the well while the drilling rig moves to the next well. The selection of a rig, associated equipment, and drilling fluids is often guided by the completion method.

What is a horizontal drilled CBM well?

Horizontally drilled CBM wells are becoming more common and have been used successfully to produce CBM from several locations in the U.S., including the Arkoma basin of Oklahoma and the Appalachian basin of West Virginia. Multilateral wells also are used, especially in coal mining applications to degas coal seams economically ahead of mining.

How do you choose a drilling rig?

The selection of a rig, associated equipment, and drilling fluids is often guided by the completion method. For example, if a dynamic-cavity completion is planned, the rig should be equipped with a power swivel for rotating, reciprocating, and circulating during cleanouts.

How deep can a CBM well be?

CBM wells range in depth from a few hundred meters to more than 3000 m. As a result, several rig types and sizes may be suitable for a given well plan.

What are the different types of drilling rigs?

The most common rig type is the conventional rotary drilling rig, although modified water-well rigs commonly are used to drill shallow coal wells in locations such as the Powder River basin of Wyoming. Other rig types include: In some cases, a drilling rig is used to drill the well to the top of the target coal seams and set/cement casing.
