What is rock drillability evaluation?

Rock drillability evaluation is a basic task for oil, gas, and geothermal drilling engineering design that includes bit design, bit selection, and drilling parameter optimization. Different tests and standards to evaluate rock drillability have been developed worldwide.

What are the drilling parameters in the database?

The drilling parameters in the database include drilling force (F), torque (T), rotational speed (N), and rate of penetration (V), from which the specific energy (SE) and the drillability index (Id) are calculated.

How to predict rock drillability?

Drilling is the dominant technology for The numerical computation provides a practical approach development HDR resources, accounting for to predict the rock drillability by analyzing the multiple approximately 35% to 60% of the overall engineering drilling parameters and constructing the correlation investment.

Can high temperature and pressure affect rock drillability?

However, its results do not reflect the significant effects of high temperature and pressure at the bottom hole on rock drillability and breaking; thus, the results cannot be used in drilling designs. Testing methods and classification standards for rock drillability require innovative developments.

Why is rock drillability important?

Rapid acquisition of rock mechanical parameters and accurate identification of rock drillability are important to guide the safe construction of different scale drilling engineering (wells and boreholes) and high-efficient excavation of rock engineering.

How does rock temperature affect ROP in HDR drilling?

The ROP increases with a growth in rock temperature, which is conducive to promote the bit penetration. The rock temperature, WOB, torque and penetration depth are strongly correlated with the ROP in HDR drilling process. The drillability of HDR is assessed into 4 levels according to the distribution of ROP.
