

Down-the-hole drill maintenance

What is a down the hole drilling machine?

A down the hole drilling machine is a tool used in the drilling process to reduce the energy loss caused by the impact energy transmitted by the drill rod. By making the impactor dive into the hole, it reduces the impact of the hole depth on drilling efficiency, allowing for a faster rock drilling speed.

What is a down hole drill used for in drilling?

A down hole drill, or DHD, is used to drill overburden and rock. Casing bits and reamers are used to drill the initial holes for installing casing and to provide an annulus for grouting. The following instructions are for a stabilizer to be used. If a stabilizer is not required, use a drill pipe from the carousel in its place.

What should I do if my drill hammer is bent?

Make sure the pipe is not bent, as this will cause undue stress on parts. As the hammer is rotated onto drill pipe, make sure thread connections are firm and tight. If not, they may need to be rechecked for excess compound or the shoulder refaced. If the connections seem good, tighten them with a wrench to proper torque.
