

Down-the-hole hammer drill operator certificate

What is down-the-hole hammer drilling?

Down-the-hole hammer drilling is a method where the drill principle consists of a combination of percussion and rotation. In this method, the hammer drill is located directly in the borehole, and these devices, known as 'down-the-hole hammers', are connected to the rotating drill pipes.

What is a down the hole hammer?

One of the most commonly used tools in the drilling industry to meet such challenging scenarios is the Down the Hole Hammer (DTH hammer). DTH hammers are most used in hard rock formations and are designed to tackle complex tasks like drilling in populated areas without putting existing structures at risk.

Are DTH hammers good for drilling?

DTH hammers therefore offer drilling efficiencies with a high rate of penetration (ROP). This is down to the fact that the air-powered hammer consistently minimizes energy loss to the drill bit, allowing it to break down the rock efficiently.

Should engineers use low pressure DTH hammers?

Engineers should consider using low-pressure DTH hammers in their drilling operations to improve drilling performance and reduce maintenance costs. Furthermore, low pressure DTH hammers can be used to drill deeper and wider holes, which can be advantageous for foundation and pile construction in urban developments.

What is a low pressure down the hole hammer?

This is where low pressure Down the Hole (DTH) hammers come in. In urban development projects, it is essential to minimize noise and vibration levels to avoid disturbing nearby residents, buildings, and infrastructure.

What is a DTH hammer used for?

DTH hammers are most used in hard rock formations and are designed to tackle complex tasks like drilling in populated areas without putting existing structures at risk. In these areas, they are ideal for drilling large diameter boreholes in hard rock formations, typically ranging from 3 inches (85mm) to 48 inches (1219mm) or more.
