Drill stems must be designed to transfer drilling torque for combined lengths that often exceed several miles down into the Earth's crust, and also must be able to resist pressure differentials between inside and outside (or vice versa), and have sufficient strength to suspend the total weight of deeper components. For deep wells this requires tempered steel tubes that are expensive, and owners spend considerable efforts to reuse them after finishing a well.

Drill Pipes: is the main component of the drill string, which forms the upper part of the drill string. It is a seamless pipe which is used to rotate the bit and circulate the drilling fluid.
