

Drill rig final drive

How do final drives work in construction equipment?

A final drive is the main power source for moving tracked construction equipment like mini excavators, skid steers, and compact track loaders. This component transfers hydraulic energy from the engine to the tracks, allowing for efficient movement and turning.

What is a final drive?

Final drives are a crucial component in heavy machinery, responsible for transferring power from the drive train to the tires or tracks. In this blog, we'll delve into the intricacies of final drives, including their function, importance, components, and maintenance.

What is a final drive in an excavator?

The final drive is not just a power transmission system; it's a cornerstone of your excavator's performance and longevity. Its ability to enhance stability, efficiency, and durability makes it an essential component for any heavy machinery. Proper maintenance of your excavator's final drive ensures its longevity and optimal performance.

Where can I find a final drive?

These are commonly found in crawler excavators, bulldozers and loaders. Our sales partner network allows us to offer new, rebuilt and used final drives for major construction equipment manufacturers such as Caterpillar, Volvo, Komatsu, Hitachi and many other. Contact us directly to receive a quote for the final drive you are looking for.

What happens if a final drive fails in construction equipment?

A final drive issue can lead to costly downtime for your crew when integrated hydraulic motors fail and cause the machine to lose mobility. In this post, we'll share what to look for to catch potential final drive problems early so you can take action early. [How Do Final Drives Work in Construction Equipment?](#)

Why is a final drive important?

If you own an excavator, skid steer, or other piece of construction equipment, you know the importance of a final drive to peak performance for your equipment. A final drive issue can lead to costly downtime for your crew when integrated hydraulic motors fail and cause the machine to lose mobility.
