What is a gimbal & how does it work?

A gimbal is engineered to provide stability and to prevent the transmission of rotational motions or vibration generated by the machineries to the platform. They also protect the supported equipment from motion and vibrations caused by waves, winds, and uneven deck.

What is oil states gimbal bearing?

Operating Pressure (psi) Proven through more than 25 years of off shore applica-tion,the Oil States gimbal bearing is designed to absorb loads imposed on the spider/riser due to vessel motion.

What size gimbals are available?

HMH spiders and gimbals are available in sizes from 60.5 in to 75.5 in and with their design,they allow for single and split lift . The spider can be split in halves with a riser joint in the rotary table . Depending on project requirements,we can offer handsfree make up of QTRTM connectors .

What are gimbals for offshore applications?

Gimbals for offshore applications have a wide range of uses,including oil and gas platforms,offshore wind farms,and marine installations. Contact us to learn more about our range of offshore gimbals and how they can meet your specific needs.

What is a 3 point gimbal?

They are used as three-point supports where each gimbal considers the characteristics of the other two supports. A gimbal is engineered to provide stability and to prevent the transmission of rotational motions or vibration generated by the machineries to the platform.

How does the HMH qtrtm gimbal work?

The tool is operated remotely by the crane operator and does not require any orientation with the riser joint. The HMH QTRTM spider and gimbal supports the drilling riser string, lower marine riser package (LMRP), and BOP stack during the drilling riser installation and retrieval operations.
