

# Drilling Angle Ruler for Down-the-Hole Drilling Rig

How do you measure directional drilling toolface angle?

In directional drilling, the drilling toolface angle measurement of the deflection tools is either up North or (Highside/Gravity). From vertical until approximately 5° inclination, gravity forces are minimal. A borehole does not have a well-defined high side (or low side). Up to this point, we set the toolface relative to North (e.g., N45W).

What is the deluxe autoangle drill guide?

The Deluxe AutoAngle adds six 1" guide rods and two flip stops. Like all Woodpeckers products, the AutoAngle Drill Guide is precisely machined and carefully inspected at our Strongsville, Ohio facility in the Cleveland suburbs. Woodpeckers Angle Drill Guide enables you to drill perpendicular or at an angle using your hand-held drill.

What are the challenges when drilling angled holes?

There are several challenges when drilling angled holes. First is getting the angle correct, next is getting the direction of angle correct, and perhaps most important, you have to get the entry point correct.

Where is woodpeckers angle drill guide made?

Like all Woodpeckers products, the AutoAngle Drill Guide is precisely machined and carefully inspected at our Strongsville, Ohio facility in the Cleveland suburbs. Woodpeckers Angle Drill Guide enables you to drill perpendicular or at an angle using your hand-held drill. Precision drilling every time.

What tools are used in directional drilling?

Surveying tools in directional drilling have been used in directional wells since the 1930s. The most straightforward tools consist of an instrument that measures the inclination and N-S-E-W direction of the well. A photographic disc within the instrument produces an image of the surveying instrument.

What is the oldest surveying tool for directional drilling?

The oldest surveying tool for directional drilling was known as an acid bottle. When taking a survey, the tool aligned itself with the hole's axis, but the surface of the acid remained level. The instrument was left in this position for about 30 minutes, allowing the acid to etch a sharp line on the glass container, which indicated the hole angle.
