What are the functions of a drill rig?

Functions: Control of centre from which driller operates the rig. It contains clutches, chains, rope sockets, engine throttles & other controls which enables rig power to be diverted to the particular operation. It houses the drum which spools the drilling line during hoisting operations & allows feed off during drilling.

What are rotary drilling rig components?

Rotary drilling's basic rig components Structure: Derrick (main component) is a steel structure of sufficient height & strength. Functions: Supports all equipments & provides vertical clearance to raising & lowering the drill string into & out of hole during drilling operations. Types: Standard. Portable. 1. Derrick & Mast

What is a drill rig made of?

Structure: made of steel (like a thread) on which flexible drilling line is folded. Functions: Control of centre from which driller operates the rig. It contains clutches, chains, rope sockets, engine throttles & other controls which enables rig power to be diverted to the particular operation.

How much power does a drilling rig use?

Function: generates power about 400-800KW (depending upon rig size, well depth & engine size). Supporting Operations: power consumed in mud pumps, draw works, crew cabins, continuous drilling operations, etc. Bulk of power is consumed by: Circulation of drilling fluid. Hoisting.
