Geographic Information System Manager, ITO The "cross" depicting the well location relative to the upper right corner of the plat is shown at C. The latitude is at A, and the longitude at B.

The grid lines on a map form a rectangular grid system, the Northerly direction of which is determined by one specified meridian of longitude, called Grid North.

The function of a derrick is to provide the vertical clearance necessary for raising and lowering the drill string into and out of the hole during drilling operations.

In this section, you will learn about mapping techniques used in directional drilling, limitations and the errors
