What is a rotary drilling rig?

The key systems of a rotary drilling rig are the power system, hoisting system, drilling fluid circulation system, rotary system, derrick and substructure, well control system, and well monitoring system. The power system typically uses diesel engines rated between 400-800 hp to power the hoisting, circulation, and rotary systems.

What is a power system on a drilling rig?

The power system on a drilling rig provides the power for the other main systems on the rig and other ancillary systems, such as electrical systems, pumps, etc. The system typically consists of a prime mover (the component of the power system that generates the raw power) and a means to transmit the raw power to the end-use components on the rig.

How does a drilling rig work?

SSDRs can move by thrusters with Dynamic Positioning System (DP), and has equipped a drilling packages like pumps, pipes and drills. It also has living quarter for crew on board. The electrical distribution system of Drilling Rigs is quite similar to typical redundancy system of electric propulsion ships made for transportation.

Do semi submersible drilling rigs have electrical service reliability?

So it is required to improve the system safety and efficiency, the power stability, the efficiency of the generation through various analysis of ship's electric power system. In this paper, the electrical service reliability of the power distribution system of semi submersible drilling rigs has been analysed and discussed using ETAP. 1.

What equipment do you need to operate a drilling rig?

Shear rams: which are the same as blind rams except that they can cut through drillpipe for emergency shut-in but should only be used as a last resort. Most drilling rigs are required to operate in remote locations where a power supply is not available. Drawworks. Mud pumps. Life support systems.
