What is a floating drilling rig?

Two key characteristics of a floating drilling rig distinguish it from an onshore or bottom-supported rig. The rig: Drills through a pipe (marine riser) connected to a BOP stack that is latched onto a wellhead at the sea floor. (Surface BOP drilling, which is discussed later in this chapter, is an exception.)

What is a semi submersible rig?

4. Semi-Submersible Rigs A Semi-Submersible rig is a Mobile Offshore Drilling Unit better known as MODU, which is designed for offshore drilling in ultra-deep waters of the oil and gas-rich areas across the globe. They are partially submerged in water during drilling operations and are normally moored to the seabed by anchors.

Do semi-submersible rigs float?

Semi-submersible rigs are buoyant and, unlike jack-up rigs which rest on the seabed, float during drilling operations. A semi-submersible rig is a drilling rig that is situated on a deck space that rests on several columns which, in turn, are attached to floating pontoons. Figure 8.12 shows a semi-submersible drilling rig.

What is a semi-submersible drilling rig?

A semi-submersible drilling rig is a floating drilling rig that is capable of working in water depths ranging from shallow through to ultra-deepwater. Semi-submersibles use a number of pontoons that are submerged beneath the water line to float and remain stable in a single location.

Should float-ing drilling operations be restricted?

For example, if float-ing drilling operations are proposed in an area with endangered aquatic species or within the migration path of such species, certain restrictions to the drilling operation could be imposed, such as transport of drill cuttings to shore, rather than disposal at sea, or increased frequency of inspections for leaks or spills.

How deep can a floating rig Drill?

(Deadweight tonnage represents how much weight a vessel can safely carry, totaling weights of cargo, fuel, freshwater, ballast water, provisions, passengers and crew.) Today's floating rigs can also drill much deeper, with wells reaching 40,000 ft in depth. (This is the depth of the well, not the water depth, which is a separate measure.)
