

How to operate a computer-controlled rock drill

How does a rock drill work?

A rotating horizontal laser plane is generated by a laser transmitter. A receiver is mounted to the rock drill. The theoretical depth (see illustration below) is entered into the system, and the drilling is automatically stopped when the vertical plane has been reached. This means that every hole has its own depth, depending on the topography.

What was the first hydraulic rock drill built by Atlas Copco?

The first hydraulic rock drill built by Atlas Copco was the 818H, built in 1976 which was driven by the most common control system used by surface crawlers today. There were no automation features available, and all operator controls were manual. One example of an Atlas Copco PLC-equipped drill rig is the ROC F9, which was introduced in 1998.

What GPS system does a drill rig use?

To achieve high accuracy, the system uses the RTK GPS system (Real Time Kinematic GPS) with which it is possible to limit error in X-Y coordinates on the drill bit to less than 10 cm. The rig itself communicates with the satellites via two separate GPS systems.

Why does a drill rig make noise?

When using a drill rig, noise is generated from several different parts of the rig such as the rock drill, the drill string, the drill bit hitting the rock, the engine, the cooler fans, and the hydraulic and pneumatic system. Since the noise is generated from various sources, it also has to be silenced in several ways.

How does a drill plan work?

The drill plan is transferred to the rig via a PC card and the drill plan is read into the system "the normal way." The operator selects a hole to drill in the drill plan. Depending on the distance to the hole, different guiding displays appear on the display, helping the operator to tram and find the correct place to start drilling.

How a drill bit is recalculated?

Depending on the Z-coordinate of the drill bit, the projection of the hole is recalculated several times per second. The calculated hole start is calculated from the predefined bottom level, up to current position of the drill bit.

Discover the perks of remote-controlled cordless drills, from precision to safety, with details on wireless systems, app integration, voice and gesture controls, and key fobs. Find ...

More complex rigs that are computer-controlled can be easier to operate with their auto feature, but the drilling may be slower than an experienced manual operator who can do more tons or ...
