What are the new products for drill and blast dust control?

We have recently launched two new products for drill and blast dust control - GRT: 12X and GRT DC Binder. The role of surface chemistry was core to the development of these new products. It is important to super-activate the water used in drilling and blasting.

What are the particle sizes of dust produced during drilling & blasting?

Particle sizes of dust are produced from drilling and blasting. There are different particle sizes of dust produced during drilling and blasting. A description of these particle sizes of dust is explained below:
>PM10 - Particle sizes of 10 microns in diameter or more also known as visible dust.

Are DTH drills better than top hammer drills?

Larger DTH drills are better suited for when the rock analysis identifies mud seams or other challenges with the rock being drilled. These drills deliver a straighter hole, can go deeper than top-hammer drills and are most suitable for hole diameters larger than 4 inches, with some exceptions.

Why is drill and dust control important?

It tackles why drill and dust control is important, finishing off with industry best practice from Global Road Technology. Natural stone quarries produce stone blocks which are separated from the bedrock by drilling and blasting. It is important to detach stone blocks and the bedrock as intact as possible from the excavation without causing damage.
