The subsea well is drilled through the marine riser allowing the mud to circulate back to the mobile drilling unit. In addition to diverter systems, riser joints, ...

Drilling risers, deployed for drilling oil wells in deep offshore, are classified as low pressure and high pressure based on the operational conditions. Production risers are developed for ...

A drilling riser is a conduit that provides a temporary extension of a subsea oil well to a surface drilling facility. Drilling risers are categorised into two types: marine drilling risers used with subsea blowout preventer (BOP) and generally used by floating drilling vessels; and tie-back drilling risers used with a surface BOP and generally deployed from fixed platforms or very stable floating platform...

These offshore riser systems are conduits (or collection of conduits) used for the safe transportation of material (primarily fluids and gases) between the seafloor and the host ...

This work presents a time-domain solution to the system of equations that model the dynamic behavior of the riser and casing strings, when connected for well ...

The subsea well is drilled through the marine riser allowing the mud to circulate back to the mobile drilling unit. In addition to diverter systems, riser joints, telescopic joints and FlexJoint(TM) ...
