

Pipeline through-the-wall screw air compressor

What is a pipeline compressor?

A pipeline compressor is a rotating or reciprocating machine used to increase the pressure of natural gas as it travels through a pipeline. This helps to maintain the flow of gas over long distances and through various terrains. What is a natural gas compressor station?

What type of pipe is used in a compressed air system?

Metal pipe used for a compressed air system can be black iron, stainless steel, copper, aluminum, etc. with proper thermal/pressure characteristics. Black Iron or Steel Pipe -- in compressed air systems will corrode when exposed to condensate (H₂O) and thus become a major source of contamination to the whole system.

What is aluminum compressed air pipe?

Aluminum compressed air pipe as applied today has become very popular. This has been developed not only to provide a smooth (low pressure loss due to friction) inner surface, and eliminate self contaminating, but also offer enhanced flexibility to meet the ever changing compressed air distribution needs.

What type of piping should I use for my air compressor?

Here again, stainless steel is our number one recommendation for the interconnecting piping from the compressor to the filter/dryers when the compressed air is oil-free. It will obviously resist corrosion much better than standard schedule 40 black iron. Some other considerations:

What are the different types of compressed air piping materials?

The compressed air piping materials can be divided into two basic types: Metal and Non-metal. Non-Metal Pipe -- commonly called "plastic" pipe has been offered for many years as compressed air piping because: What has held back this materials acceptance by many compressed air people and organizations?

What size pipe should I use before starting a compressor?

Before Starting the Compressor. If running over 50 feet (confirm with manufacturer) increase pipe size at least 1 size or greater over filter housing connection size. Always try to increase Inlet Air Piping one or two sizes above compressor connection size. Never reduce inlet pipe size from connection size on the unit.
