

Reasons for diesel engine air compressor to automatically shut down

What causes frequent air compressor shutdowns?

This comprehensive blog post will delve into the common causes of frequent air compressor shutdowns and provide practical solutions to address them. Overheating is a major cause of air compressor shutdowns. When the compressor operates under excessive heat, it triggers a safety mechanism that automatically shuts it off to prevent damage.

What is a compressor shutdown?

The phenomenon of compressor shutdown refers to the automatic stopping of the compressor during operation due to the activation of its protection mechanism. As a common fault, compressor shutdown issues are often triggered by various factors.

Are compressor shutdown issues a common problem?

However, compressor shutdown issues are a common problem that troubles many users. This not only leads to frequent equipment failures but can also cause production interruptions, increase maintenance costs, and even impact the final product quality.

What causes a compressor to stop working?

Overpressure or underpressure: Faulty or improperly set pressure sensors, or operating pressures outside the normal range, can trigger safety protection. Pipeline leakage: Unstable system pressure can lead to frequent compressor starts and shutdowns.

Why is my air compressor overheating?

Consider upgrading to a larger tank. If the air compressor draws more current than the electrical circuit can handle, it can cause an electrical overload. This can be caused by: Faulty Motor: A malfunctioning motor can draw excessive current, leading to an overload. Have the motor inspected by a qualified technician.

What happens if Air Compressor tank is too small?

Undersized Air Tank: A tank that is too small for the compressor's capacity may not be able to maintain adequate air pressure. Consider upgrading to a larger tank. If the air compressor draws more current than the electrical circuit can handle, it can cause an electrical overload.
