How much water do you add to a drill hole?

A rule of thumb is to add 0,25 litres of water per m³ compressed air. The occurrence of water in the drill hole is common. Both "too little" and "too much" can be troublesome. Too little water tends to bind the drill cuttings into a paste, which sticks to the drill pipes or the hole wall and can easily form plugs.

How do you control fugitive dust in a drill rig?

Dust-suppression and crushed-rock-cutting collection systems are available on many drill-rig models to help control fugitive dust. Rubber skirts and water-misting controls contain rock fines and dust around the blasthole collar. Cyclone mechanical dust collectors remove drill cutting from the hole collar and place them alongside the drill rig.

How do you lubricate a drill rig?
