

Screw air compressor air pipe has water

How does a screw type compressor work?

Screw type compressors have two interlocking helical rotors within its housing. Air from the surroundings is introduced into the compressor through the inlet valve (blue), and is trapped between the two rotors. The screws turn and "compress" the air, reducing the volume while increasing the pressure of the air (red).

How does water affect compressor performance?

Water can also affect the performance of the system when it gets into the compressed air stream. Certain compressor applications can suffer from water in the air stream. Two major examples are spray painting and sandblasting. Moisture in the air stream when spray painting can negatively affect the texture and finish.

How much water does an air compressor produce?

The amount of water produced by an air compressor is largely dependent on the inlet condition, ambient air quality, and pressure. In simpler terms, air temperature, humidity, compressor size, and required pressure determine the amount of water coming from a unit. This moisture affects the whole system, including piping.

How fast does water build up in a compressor?

How fast water builds up in your compressor depends on the temperature and humidity in your area. Warmer air can hold more moisture, so the summer months can cause quick build ups of water in your compressor -- especially if you live somewhere with high humidity. However, no matter the season or temperature, there's always moisture in the air.

How does a water compressor work?

For factories that are located near the ocean, the amount of water produced might be even higher. As discussed above, the compressor takes in air from the surroundings and compresses it, increasing its pressure for end-use application.

Why does my air compressor make water?

The normal process of running your air compressor will create water as a byproduct. As normal, ambient air contains water vapor in the form of humidity and condensation is a normal process that occurs in everyday life; this should not be too surprising. However, four main factors that can influence the amount of water you are
