What is the normal operating temperature of an air compressor?

The normal operating temperature of an air compressor typically ranges between 75°C to 95°C. One of the common air compressor failure is overheating of the air compressor. For screw air compressors, operating temperatures exceeding 100°C will cause high-temperature alarms or shutdowns within the system.

What is the operating ambient temperature of a screw air compressor?

The operating ambient temperature of the air compressor is significantly affected by this. Screw air compressors usually require the working ambient temperature not to exceed 45°C.

Why do screw air compressors have high temperatures?

Screw air compressors often have high temperatures in industrial production due to high ambient temperature, insufficient lubricating oil, radiator blockage and other problems, affecting the efficiency and life of the equipment.

What is the ideal temperature for compressed air equipment?

What Is the Optimal Temperature for Compressed Air Equipment? The ideal operating temperature of an air compressor is between 50 and 85°F. Within this temperature range, the mechanical components can operate safely without the risk of freezing or overheating.

What is a good oil temperature for a screw compressor?

For air-cooled compressor systems, the ideal oil operating temperature for screw compressors is 175-190°F. If your compressor's temperatures are over 200°F for a sustained period of time, your oil is likely degrading. Among other things, above-normal discharge temperature could be an indication that the thermal valves are not working properly.

Why do rotary screw air compressors need thermal valves?

Rotary screw air compressors need thermal valves to force them to run at elevated temperatures to keep water from condensing in the oil at elevated pressures. For this to occur, the oil's discharge temperature should be kept at least 100°F above the ambient air temperature.

Maintaining the correct oil temperature is crucial for the proper functioning of screw air compressors. Statistics show that the ideal operating oil temperature ranges between 80°C ...

Screw air compressors often experience high temperatures due to high ambient temperature, insufficient lubricating oil, radiator blockage.
