

Screw air compressor stinks at high temperature

What causes a screw air compressor to fail?

The repaired air compressor failures include, but are not limited to, high temperature, insufficient air pumping, overpressure of the main engine, overload of the motor, and excessive noise. Among them, the high temperature of screw air compressor is caused by many reasons, external and own reasons.

Why do screw air compressors have high temperatures?

Screw air compressors often have high temperatures in industrial production due to high ambient temperature, insufficient lubricating oil, radiator blockage and other problems, affecting the efficiency and life of the equipment.

Why does my compressor trip on over temperature?

If your compressor trips on over temperature, it could be any of the following: Ambient temperature too high or not enough ventilation. A screw compressor can run loaded ('pumping air') or unloaded ('idle'). The inlet/loading valve opens and closes according to air demand.

What happens if the air compressor coil is too high?

If the panel prompts that the motor coil is high temperature, the solution is still to use low-pressure air to purge the heat dissipation part of the motor. It is specially reminded that if the operating environment temperature of the air compressor is too high, it will also cause the temperature of the equipment to increase.

How to prevent high temperature of air compressor?

Through daily maintenance and correct operation, enterprises can effectively prevent high temperature of air compressors and ensure production efficiency and equipment life. The operating ambient temperature of the air compressor is significantly affected by this.

What is the operating ambient temperature of a screw air compressor?

The operating ambient temperature of the air compressor is significantly affected by this. Screw air compressors usually require the working ambient temperature not to exceed 45°.
