

Screw air compressor temperature control valve core replacement video

What is a temperature control valve of a screw air compressor?

The temperature control valve of the screw air compressor is composed of: the temperature control valve is composed of a valve body, a valve core, a temperature sensing element, a spring, and so on.

How does a screw compressor work?

A screw compressor can run loaded ('pumping air') or unloaded ('idle'). The inlet/loading valve opens and closes according to air demand. The inlet valve is controlled by a solenoid valve that supplies control air to the inlet/loading valve. Check solenoid valve coil and solenoid valve operation.

What happens if a screw air compressor is too cold?

(1) When the exhaust temperature of the screw air compressor head is too low for a long time (such as cold start/severe cold environment), moisture will precipitate in the oil and gas barrel of the air compressor, causing the lubricating oil to emulsify and damage the machine. The air compressor needs to be preheated when it is turned on.

What causes a temperature control valve to fail?

(2) The lubricating oil entering the temperature control valve is not filtered, and the internal passage of the temperature control valve is more complicated, which is easy to cause dirt accumulation. Long-term use will cause a higher failure rate of the temperature control valve.

How do I know if my air compressor is working?

If you have a compressed air dryer, check the dewpoint. Check the current draw with a current clamp meter. If the motor draws excessive current: Try to turn the compressor by hand. It should be possible to turn it around. It should turn around smoothly, without any 'hiccups' (be sure to completely shut down the air compressor!).

What should I do if my air compressor is too low?

If the capacity of the air compressor is really too low, check the following: Check differential pressure over oil separator. Replace separator when necessary. Check and replace compressed air filters (if installed). Compressor does not unload. Check if pressure switch is correctly set and working.

The oil in oil-air separator is driven into oil pipe under the air pressure, then goes through the temperature control valve, oil cooler and the oil filter, finally is divided into two flows, one flow ...
