Can I design a seismic drill buggy?

You can design a seismic drill buggy for your specific jobs, the terrain you will be on, and the workload. Here at Wetland Equipment, we can make a variety of seismic drills, such as shot hole drilling or explosive drilling, plasma sound source or sparker rigs, seismic vibrator rigs, and boomer source rigs.

How does a seismic drill work?

In seismic drilling, a company uses a specially designed drill to dig a hole to the desired depth. Air and water drills are both available for this purpose, and they are often mounted on sledges or mobile platforms. This allows the team to quickly move the drill between locations, which can be critical on a large survey.

What is seismic drilling?

Seismic drilling, also known as shot hole drilling, is drilling conducted as part of a seismic survey of a geologic formation. In such surveys, the team uses a series of controlled vibrations to generate a map of subsurface structures.

What is a geotechnical drilling rig?

A geotechnical drilling rig is a highly refined geotechnical drilling system designed, built, and supported as one. It benefits field users, business owners, and project managers alike. Don't see a feature or tool you're seeking for your geotechnical drilling? Give us a call.

Are wetland equipment seismic drill buggies worth the cost?

Wetland Equipment works closely with customers during the design and manufacturing process, so each seismic drill buggy is tailored to your exact needs. Because they are completely customizable, our seismic drill buggies are well worth the expense.

What is land seismic shot-hole drilling?

Land Seismic Shot-Hole Drilling is a critical part of Oil and Gas Exploration programs onshore. The process consists of drilling a series of vertical holes, up to 25-30 m deep, at approximately 180-185 m intervals. These seismic shot-holes are then loaded with explosives and detonated in a precisely controlled sequence.
