What is a drill rig?

A drill rig is the main equipment used to drill down into the earth to get core samples. It is mounted with different types of drill bits, core barrels, and other extractive tools so a portion of the drilling process can be recovered and extracted from the subsurface. Core barrels are tubular structures where the core is collected as it is drilled.

What are the different types of core extraction methods?

The key methods are listed below: Rotary core drilling is the most common core drilling method of core extraction, especially for deep formations. The rotating drill bit with a core barrel cuts through the rock. As the drill advances, the core is collected. This is good for hard rock formations.

What are the three parts of the core drilling process?

For people who are more visual and who prefer to watch a demonstration than to read about it, these videos are great. This latest video in our series reviews the three parts of the core drilling process: drilling, retrieving the core sample and resuming the drilling. Together they make a round trip and with each one, the bore hole gets deeper.

What do you learn in a Core Drill Course?

You'll learn about core bits, reaming shells, core barrels, inner tubes, drill rods, casing, how they all fit together and what their purpose is. The video does an excellent job of describing how core drilling works visually, with clear animation.

What is core drilling?

Core drilling is the method of extracting cylindrical pieces of rock or sediment from the earth. These samples are useful in determining the geological characteristics of the natural deposits.
