

Videos of repairing and modifying rock drills

What happens if you over drill a drill bit?

Penetration rate is improved significant after grinding bit, please see more Excessive over drilling of bits will cause damage not only to all drilling tools but also to rock drill and rig The flat worn area of the button should not exceed $1/3$ of its diameter These have all 100% flat buttons and have caused a lot of damage

Why do drill bits need to be ground?

Sometimes the steel in the bit body is not worn away at the same rate as the cemented carbide in the buttons This to maintain good flushing at the front, good penetration rate and avoid re-crushing of drill cuttings, for importance of flushing please read this Then the buttons must be ground to maintain same button protrusion as on a new bit

What factors affect a drill bit service life?

Rock drillability, machine type and settings and operator skills are the major factors influencing wear rates and tool life The drill bit service life in particular is very much related to rock properties, its mineral content, grain size and structure
