Whether you're using a reciprocating compressor, a portable rotary screw, or a stationary rotary screw, this issue usually comes down to power, load, or airflow problems.

What causes a compressor to shut off?

Broken Pistons: Worn or broken pistons can cause the compressor to lose compression and shut off. **Faulty Valves:** Malfunctioning valves can disrupt the proper flow of air, leading to shutdowns. **Leaking Seals:** Leaks in seals can cause air loss and reduce the compressor's efficiency, eventually causing it to shut off.

Why does my air compressor start and stop?

Power is going to motor but still the compressor starts and stops! It is possible that the compressor motor is overheating. Most compressor motors will have a thermal cut-out via an air compressor thermal overload switch. This device will cut the power before heat-related damage can occur to the motor.

Do rotary screw compressors have problems?

Rotary screw compressors are known for their reliability and efficiency, but like any complex system, they can encounter issues over time. Whether it's insufficient air pressure, unusual noises, or frequent shutdowns, these problems can disrupt operations and increase costs if not addressed promptly. This guide is here to help.

Why does my compressor stop if the pressure switch is off?

If the tank pressure is between cut in and cut out, and the compressor has stopped, check to be sure power is still on the motor side of the switch. If not, once again, the pressure switch is suspect. Power is going to motor but still the compressor starts and stops! It is possible that the compressor motor is overheating.

How does a screw compressor work?

A screw compressor can run loaded ('pumping air') or unloaded ('idle'). The inlet/loading valve opens and closes according to air demand. The inlet valve is controlled by a solenoid valve that supplies control air to the inlet/loading valve. Check solenoid valve coil and solenoid valve operation.
