

What is the normal nitrogen pressure of a rock drill

Should air pressure be increased at drills?

The decision to increase the air pressure at the drills should not be determined solely on the basis of the anticipated increase in production and the increase in the cost of compressed air and drilling equipment. Drilling is only one item in a chain of operations, which includes drilling, blasting, loading, and hauling.

What type of air drilling is required?

The type of air drilling required depends on drill site conditions, including presence of wellbore fluid influxes or oil-based mud. Air drilling methods include dust drilling, mist drilling, foam drilling, aerated drilling, and nitrogen membrane. Dust drilling is another term for air drilling; compressed air is the sole circulating medium.

What is a membrane nitrogen drilling unit?

Membrane units usually reduce operating costs when compared to cryogenic (liquid) nitrogen drilling and transportation problems related to liquid nitrogen are eliminated. The US patent for nitrogen membrane drilling is held by Weatherford, which owns the largest fleet of on-site generated membrane Nitrogen Production Units in the world.

What if the air rock drill is dangerous?

Drilling should be limited to normal risk conditions. If the Air Rock Drill is to be operated in a dangerous or hostile environment, the user/client is responsible for conducting an appropriate risk analysis and applying suitable controls to mitigate those additional risks. This instruction should be read in conjunction with the Risk Assessment.

What is the difference between drill rate and volume of rock?

The volume of rock, or drill rate, is the product of both (Figures DP-1a and -1b). Indentation depths are not large, and most of the volume of rock removed is from rotation and the distance the cutters slide per minute.

What is a safe working zone for air rock drill?

As per manufacturers recommendations All necessary guards & safety devices are in place protecting workers from all moving & rotating parts. "Safe Working Zones" are clearly defined in all work spaces where air rock drill is being used.
