

Why don't rock drills use engines

Why should you use a rock drill?

Your work is made relatively more manageable and simpler through the proper usage of Rock Drills or Drifters as they are sometimes known. The fact that they can be used remotely means that you will be safe while doing your mining work. You can keep a safe distance and let the drill do all the work.

How does a hydraulic rock drill work?

The hydraulic rock drill uses high-pressure oil as the power to drive the piston to impact the drill bit, with an independent rotary mechanism. The piston is controlled by a valve to perform reciprocating motion, and the drilling speed is more than twice that of the pneumatic rock drill.

Why do modern rock drills need lubrication?

All rock drills produce dust which is hazardous to inhale, causing widespread silicosis among ancient miners. Modern rock drills flood the borehole with water to capture the dust and improve the air quality in the mine. This has the additional benefits of lubricating and cooling the drill bit.

What is a machine rock drill?

Machine rock drills come in two basic forms: those that operate by percussion (using a reciprocating motion), and those that are abrasive (using a rotary motion). A smaller, hand-held percussion rock drill is considered a type of jackhammer. A pneumatic rock drill. The detachable drill bit is not shown, but would be at left.

Are rock drills a necessity in underground mining?

Rock Drills are almost a necessity in underground mining. Your work is made relatively more manageable and simpler through the proper usage of Rock Drills or Drifters as they are sometimes known. The fact that they can be used remotely means that you will be safe while doing your mining work.
